

ARE YOU BEING CYBER SMART?

Lock it down

Protect your accounts with long, strong and unique passphrases and multi-factor authentication (MFA). Two simple changes can make it much harder for cyber criminals to get in.

Think before you click

Pause before you click. AI is making scams more convincing than ever, so take a moment to stop, think and verify before you trust.

Don't overshare

Think twice before sharing personal information online or pasting sensitive information into AI tools. If in doubt, leave it out. The less information cyber criminals can find, the less they can use against you.

Keep it current

Turn on automatic updates so your devices and apps can protect themselves against the latest security threats.

Protect home base

Secure your home Wi-Fi by changing your router's default password to a long, strong and unique passphrase. Keep connected devices updated and consider using a guest network for smart devices.
